Univariate

Definition: Univariate data analysis focuses on a single variable or dataset, examining its characteristics and distribution.

Objective: The primary goal is to describe and summarize the data, understand its central tendency, and identify patterns, outliers, and potential trends within that single variable.

Methods: Common methods include histograms, bar charts, box plots, summary statistics (mean, median, mode), and measures of dispersion (variance, standard deviation)

```
plt.figure(figsize=(12, 10))

plt.subplot(4, 2, 1)
plt.plot(df['total'], 'b')
plt.title('Total')

"""
```

Total (Blue Line):

The graph shows the trend in total car crashes over the dataset.

Inference: There is a noticeable variation in the total number of car crashes over time, but no specific pattern emerges.

"""

```
plt.subplot(4, 2, 2)
plt.plot(df['speeding'], 'g')
plt.title('Speeding')
```

"""

Speeding (Green Line):

This graph represents the trend in car crashes caused by speeding.

Inference: The number of car crashes due to speeding appears to have some fluctuations but doesn't show a consistent upward or downward trend.

"""

```
plt.subplot(4, 2, 3)
plt.plot(df['alcohol'], 'r')
plt.title('Alcohol')
```

"""

Alcohol (Red Line):

The graph displays the trend in car crashes related to alcohol consumption.

Inference: There is some variation in car crashes involving alcohol, but no clear trend is evident from the graph.

"""

```
plt.subplot(4, 2, 4)
plt.plot(df['not_distracted'], 'c')
plt.title('Not Distracted')
```

"""

Not Distracted (Cyan Line):

This graph illustrates the trend in car crashes where drivers were not distracted.

Inference: The number of car crashes by non-distracted drivers shows fluctuations, but no significant trend is apparent.

"""

```
plt.subplot(4, 2, 5)
plt.plot(df['no_previous'], 'm')
plt.title('No Previous')
```

"""

No Previous (Magenta Line):

The graph shows the trend in car crashes by drivers with no previous incidents.

Inference: Car crashes by drivers with no previous incidents appear to have some fluctuations but no discernible trend.

"""

```
plt.subplot(4, 2, 6)
plt.plot(df['ins_premium'], 'y')
plt.title('Insurance Premium')
```

"""

Insurance Premium (Yellow Line):

This graph represents the trend in insurance premiums.

Inference: The graph doesn't provide clear insights into the trend in insurance premiums over time, as it seems to fluctuate without a discernible trend.

"""

```
plt.subplot(4, 2, 7)
plt.plot(df['ins_losses'], 'k')
plt.title('Insurance Losses')
```

"""

Insurance Losses (Black Line):

The graph displays the trend in insurance losses.

Inference: Similar to insurance premiums, insurance losses also appear to fluctuate without a clear trend.

"""

```
plt.tight_layout() # Used to allocate gaps between the labels and plots
```

Barplot

```
plt.figure(figsize=(18, 9))
sns.barplot(data=df, x='abbrev', y='total', errorbar=None)
plt.xlabel('State Abbreviation')
plt.ylabel('Total Crashes')
plt.title('Total Crashes vs. State Abbreviation')
```

"""

Inference:

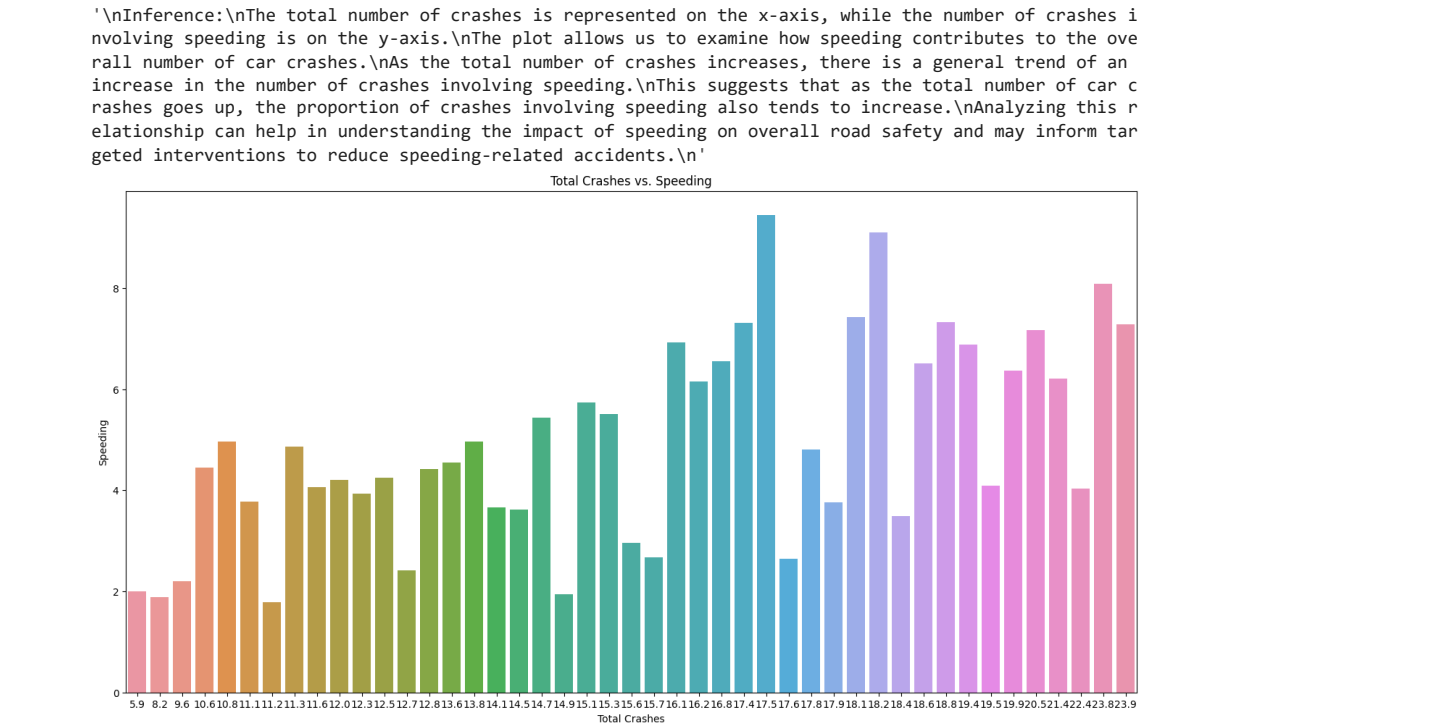

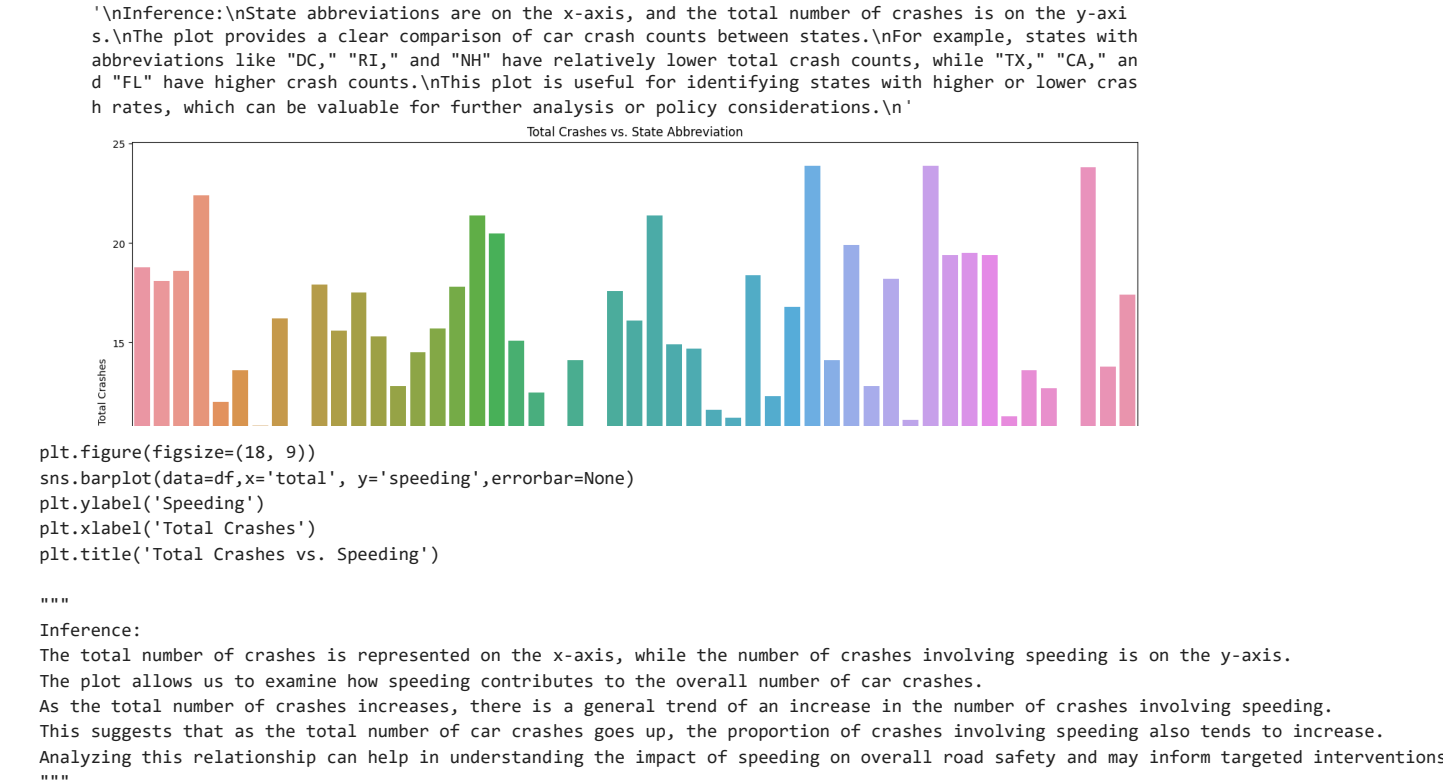

State abbreviations are on the x-axis, and the total number of crashes is on the y-axis.

The plot provides a clear comparison of car crash counts between states.

For example, states with abbreviations like "DC," "RI," and "NH" have relatively lower total crash counts, while "TX," "CA," and "FL" have relatively higher total crash counts.

This plot is useful for identifying states with higher or lower crash rates, which can be valuable for further analysis or policy considerations.

"""

Boxplot

```
plt.ylabel('Speeding')
plt.xlabel('Total Crashes')
plt.title('Total Crashes vs. Speeding')
```

```
"""
Inference :
The box plot shows the distribution of speeding-related crashes within different total crash categories.
As the total number of crashes increases, there is increasing variability in the number of crashes involving speeding.
This highlights the relationship between total crashes and speeding incidents, indicating the need for targeted interventions in states c
"""

plt.ylabel('Total Crashes')
plt.title('Total Crashes vs. State Abbreviation')
```

```
"""
Inference :
The box plot illustrates the distribution of total crashes concerning the distraction status of drivers (Not Distracted).
It provides insights into how distraction affects the total number of car crashes.
The plot shows varying total crash counts based on the distraction status, with potentially higher crashes when drivers are not distracte
This suggests that non-distracted drivers may be involved in more crashes, emphasizing the need for examining the causes of distraction a
"""
```

Inference :The box plot illustrates the distribution of total crashes concerning the distraction status of drivers (Not Distracted).It provides insights into how distraction affects the total number of car crashes.The plot shows varying total crash counts based on the distraction status, with potentially higher crashes when drivers are not distracted.This suggests that non-distracted drivers may be involved in more crashes, emphasizing the need for examining the causes of distraction and driving behavior to improve road safety.

Histogram

```
sns.histplot(data=df, x='total', bins=20, kde=True)
plt.xlabel('Not_Distracted')
plt.ylabel('Frequency')
plt.title('Distribution of Total Crashes')
```

Inference :
The histogram displays the distribution of total car crashes.
The plot shows that the majority of observations fall within a relatively low range of total crashes, with a peak in frequency.
There is a right-skewed distribution, indicating that a few instances have significantly higher crash counts.
This visualization helps understand the distribution of total crashes, which can be useful for identifying common crash count ranges and outliers in the dataset.

Inference :The histogram displays the distribution of total car crashes.The plot shows that the majority of observations fall within a relatively low range of total crashes, with a peak in frequency. This pie chart allows for a quick comparison of the contribution of each state to the total number of car crashes in the dataset.

Bivariate

Definition: Bivariate data analysis involves the analysis of two variables to explore their relationship and interactions.

Objective: The primary goal is to understand how two variables are related, whether they exhibit correlation or causation, and to identify patterns or associations between them.

Methods: Common methods include scatter plots, line graphs, correlation coefficients (e.g., Pearson correlation), and hypothesis tests (e.g., t-tests) to determine if relationships are statistically significant.

Scatterplot

```
sns.scatterplot(x="total",y='speeding',data=df)
plt.ylabel('Speeding')
plt.xlabel('Total Crashes')
plt.title('Total Crashes vs. Speeding')
```

"""

Inference :

The scatter plot visualizes the relationship between the total number of car crashes and the number of crashes involving speeding. There doesn't appear to be a strong linear relationship between total crashes and speeding incidents based on this scatter plot. The points are scattered across the plot without a clear trend, suggesting that total crashes and speeding may not be strongly correlated. Further statistical analysis may be needed to quantify the relationship between these variables accurately.

"""

Inference :
The scatter plot visualizes the relationship between the total number of car crashes and the number of crashes involving speeding. There doesn't appear to be a strong linear relationship between total crashes and speeding incidents based on this scatter plot. ```
sns.scatterplot(x="total",y='no_previous',data=df,c='g')
plt.ylabel('No_Previous')
plt.xlabel('Total Crashes')
plt.title('Total Crashes vs. No_Previous')
```

"""

Inference :

The scatter plot illustrates the relationship between the total number of car crashes and crashes involving drivers with no previous incidents. Similar to previous scatter plots, there isn't a distinct linear relationship between total crashes and crashes involving drivers with no previous incidents. The points are scattered without a clear trend, suggesting that total crashes may not directly correlate with the absence of previous incidents.

"""

'\nInference :\n\nThe scatter plot illustrates the relationship between the total number of car crashes and crashes involving drivers with no previous incidents.\n\nSimilar to previous scatter plots, there is n't a distinct linear relationship between total crashes and crashes involving drivers with no previous incidents.\n\nThe points are scattered without a clear trend, suggesting that total crashes may not directly correlate with the absence of previous incidents in drivers. Further analysis may be needed.\n'

Lineplot

```

sns.lineplot(x="total",y="alcohol",data=df,errorbar=None)
plt.ylabel('Alcohol')
plt.xlabel('Total Crashes')
plt.title('Total Crashes vs. Alcohol')
"""

```

Inference :

The line plot shows the association between total car crashes and crashes involving alcohol.

It visualizes how alcohol-related crashes fluctuate concerning the total number of crashes.

There isn't a clear linear relationship; the points on the line are scattered without a distinct pattern.

This suggests that the total number of crashes may not have a straightforward correlation with alcohol-related incidents, warranting further analysis.

'\nInference :\n\nThe line plot shows the association between total car crashes and crashes involving alcohol.\n\nIt visualizes how alcohol-related crashes fluctuate concerning the total number of crashes.\n\nThere isn't a clear linear relationship; the points on the line are scattered without a distinct pattern.\n\nThis suggests that the total number of crashes may not have a straightforward correlation with alcohol-related incidents, warranting further analysis.\n'

```

sns.lineplot(x="total",y="ins_premium",data=df,errorbar=None)
plt.ylabel('Insurance_Premium')
plt.xlabel('Total Crashes')
plt.title('Total Crashes vs. Insurance_Premium')
"""

```

Inference :

The line plot represents the relationship between total car crashes and insurance premiums.

It visualizes how insurance premiums vary in relation to the total number of crashes.

The plot does not show a clear linear trend; points on the line are scattered without a clear pattern.

This suggests that the total number of crashes may not have a straightforward correlation with insurance premiums, necessitating further analysis.

'\nInference :\n\nThe line plot represents the relationship between total car crashes and insurance premiums.\n\nIt visualizes how insurance premiums vary in relation to the total number of crashes.\n\nThe plot does not show a clear linear trend; points on the line are scattered without a clear pattern.\n\nThis suggests that the total number of crashes may not have a straightforward correlation with insurance premiums, necessitating further investigation.\n'

Replot

```
sns.relplot(x="total",y="speeding",data=df,hue="abbrev")
plt.ylabel('Speeding')
plt.xlabel('Total Crashes')
plt.title('Total Crashes vs. Speeding')
```

"""

Inference :

The relational plot ("relplot") displays the relationship between total car crashes and crashes involving speeding. Each point represents a data point in the dataset, with different states distinguished by colors (hue).

The plot allows for a quick visual assessment of how speeding-related crashes vary concerning the total number of crashes in different states. There is no clear linear trend; points are scattered without a distinct pattern, indicating that the relationship between total crashes and speeding-related crashes is not straightforward.

Multivariate

Definition: Multivariate data analysis deals with the examination of three or more variables simultaneously, often in complex datasets.

Objective: The primary goal is to uncover intricate relationships, dependencies, and patterns involving multiple variables. It aims to explore how these variables collectively impact the outcome or phenomenon under study.

Methods: Common methods include multiple regression analysis, principal component analysis (PCA), factor analysis, cluster analysis, and machine learning techniques like decision trees, random forests, and neural networks. These methods enable the exploration of complex interactions and dependencies among multiple variables.

```

'\nInference :\n\nThe heatmap visualizes the correlation between different variables in the dataset.\n\nDarker colors indicate stronger positive correlations, while lighter colors represent weaker or negative correlations.\n\nThe heatmap allows for a quick assessment of which variables are strongly correlated and which are not.\n\nFor example, if two variables have a dark-colored cell, it indicates a strong positive correlation between them.\n\nThis visualization is valuable for identifying potential relationships and dependencies within the dataset.\n'
